OMH EVALUATION PLANNING GUIDELINES

The Government Performance and Results Act of 1993 (GPRA) requires that Federal programs provide information about program goals, performance relative to program goals, and results regarding program effectiveness and cost efficiency in the spending of Federal funds. In order to support OMH's ability to comply with GPRA and to demonstrate "returns on the investment" in the Office's grant programs, all grantees must be able to produce documented results that demonstrate whether and how the strategies and activities funded contribute to improvements in the health of racial/ethnic minorities, reductions in health disparities that place a greater burden of preventable disease/disability and premature death on such populations, and/or improvements in systems approaches for addressing these problems. To this end, all grant applicants are required to provide with their application an evaluation plan for all proposed funded activities.

The steps outlined below are intended to provide guidance to OMH grant applicants on the development of an evaluation plan and the key components for identifying how proposed projects and activities will be evaluated to determine if intended results have been achieved (see **Appendix 1** for a brief glossary of terms). Following these steps will help promote more systematic and consistent processes for grantee evaluations that are linked to OMH's mission and objectives under the *National Partnership for Action to End Health Disparities*.

Step 1: Identify and define the problem and factors contributing or causing the problem that will be addressed by the proposed project and activities

- <u>Identify the problem</u>.--Grant applicants should specify the particular problem(s) that they are
 proposing to address (e.g., diabetes, heart disease and stroke, HIV/AIDS, motor vehicle
 accidents, methamphetamine abuse, lack of access to health care, lack of infrastructure,
 language barriers).
- Review and use available data about the problem.—As much as possible, review and use data to support knowledge and understanding about the particular health condition(s), racial/ethnic minority or other target population(s), health disparities problem(s), and/or systems issue(s) to be addressed. In some cases, the problem that the proposed activity may be aiming to address is a gap or weakness in data to inform program and policy decision-making (e.g., lack of data on health care access and utilization by members of a particular Tribal community to ensure adequate and appropriate diagnosis and treatment of chronic health conditions). The point here is to provide objective evidence of the nature and extent of the problem. Some examples of potential data sources that may be useful in describing racial/ ethnic minority health or systems problems, and factors contributing to such problems, are provided in **Appendix 2**.
- Focus on priority issues.--Using available data, describe the importance of the particular problems to be addressed and why the problems are priority issues for the State, region, Tribal area, or community within which the proposed funded effort will take place. The extent to which addressing the particular priority issues will contribute to the objectives of the grant program, the OMH-wide objectives of the National Partnership for Action to End Racial and Ethnic Health Disparities, and Healthy People 2010 (HP2010) objectives for

priority racial/ethnic minority health and systems issues should also be described. (For reference, see the items below).

- The OMH-wide objectives for the National Partnership for Action to End Racial and Ethnic Health Disparities and the program-specific objectives are listed in the grant program announcements and guidelines.
- All Healthy People 2010 objectives, including those that are population-based, are identified by focus area on the Healthy People website (see www.healthypeople.gov). HP2010 objectives and indicators can also be accessed at http://wonder.cdc.gov/data2010. Grant applicants are strongly encouraged to take special note of those HP2010 objectives identified in Appendix 3 for priority health and systems focus areas of particular relevance to racial and ethnic minority health, and those objectives and sub-objectives that are not making progress with respect to the particular racial/ethnic minority group(s) being targeted (see Appendix 4 for a list of these objectives/sub-objectives).
- Identify contributing or causal factors to be addressed.—To the extent known by available data, identify the factors contributing or causing the long-term problems that are being addressed in the proposed project or activities. For e.g., factors contributing or causing diabetes may include, but are not limited to: lack of awareness and knowledge about the connections between diet, exercise, obesity, and diabetes; lack of healthy food choices in local grocery markets and restaurants, or lack of safe venues in the neighborhood to engage in physical activity, sports, and recreation; or the lack of language assistance services in health care settings to minimize systems barriers to access and utilization for limited-English-proficient individuals at risk for diabetes.

Step 2: Specify "best" or "evidence-based" strategies and practices being used in proposed project activities in relation to the problem and factor(s) to be addressed

- <u>Specify proposed project activities to be conducted or implemented</u>.—Based on the priority health or systems issues—and factors causing or contributing to these issues—identified above, specify the project activities and/or interventions that will be conducted to influence or impact the factors and, ultimately, to resolve the issue(s).
- <u>Draw from existing science or knowledge about "what works"</u>.—As much as possible, proposed activities and/or interventions should build upon existing science and knowledge about "promising," "best," or "evidence-based" practices (or "what works"). The questions that grant applicants should answer are: What is the basis for believing that the project and activities proposed are likely to be <u>effective</u> in addressing the priority problem(s) and contributing/causal factors identified? What evidence exists from expert consensus panels, peer-reviewed scientific journals, findings from research or evaluation studies to suggest that the proposed strategy or practice has promise or may/will yield a meaningful result? For example, the recommendations of the U.S. Preventive Services Task Force, at http://www.ahrq.gov/clinic/uspstfix.htm#Recommendations, and those of the Task Force on Community Preventive Services, at www.thecommunityguide.org, are drawn from existing scientific evidence of effective clinical and community-based prevention practice. Other sources of "evidence-based" programs and "best" practices include, but are not limited to: the Substance Abuse and Mental Health Services Administration's (SAMHSA's) National

Registry of Evidence-Based Programs and Practices, a database of interventions for the prevention and treatment of mental and substance use disorders, at http://nrepp.samhsa.gov), and the "Community Toolbox" at the University of Kansas on community health and development practices, at http://ctb.ku.edu.

 Organize proposed project activities.—Organize selected project activities to facilitate a clear link between the activities, the contributing/causal factors and priority problems being addressed by the activities. This will help in addressing subsequent steps.

Step 3: Identify Outcomes, Impacts, and Performance Measures for the Proposed Activities

Specify expected outcomes or impacts for project activities (i.e., the results).—As grant applicants consider and plan their proposed activities, they need to identify the outcomes and/or impacts (i.e., the results) that might be expected to take place following implementation of their projects and activities. The outcomes/impacts identified will guide the design and selection of methods for evaluating the effectiveness of project activities.

Once expected outcomes/impacts are identified, it is then necessary to determine how "success" in achieving these impacts and outcomes will be measured. The questions to consider include: how project managers or staffs will know if their intended outcomes or impacts have been achieved; what will be counted; and what will be the 'indicators' or measures of the change or progress that occurred as a result of project activities. In evaluation, typical measures reflect inputs, outputs, processes, outcomes, and impacts (see definitions below).

- Input Measure: a measure of what an agency or manager has available (e.g., funding, staff, facilities or equipment, supplies, etc.) to carry out the program or activity to produce an output or outcome
- Output Measure: a measure of a product, service, or result of a particular activity (e.g., number of people vaccinated with the influenza vaccine, number of personnel trained; number of phone calls processed by the OMH Resource Center); this type of measure provides information about the activity, not the success in achieving the objectives and goals of the program/project
- Process Measure: a measure of the procedures, tasks, or processes involved in implementing program or project activities to produce an output or outcome (e.g., availability of trained medical interpreters at the time of a doctor's visit by a patient with limited-English-proficiency)
- Outcome Measure: a measure of an event, occurrence, condition, or result of a program or project that indicates achievement of objectives and goal(s); this type of measure is used to measure the success of a program, project, or system (e.g., the percentage of people who do not get influenza); typically, an outcome measure reflects short- and intermediate-term results (as compared to impact measures)
- ➤ <u>Impact Measure</u>: a measure of the direct or indirect long-term effects or consequences of the outcomes (in terms of overall effectiveness or efficiency), resulting from achieving

program or project objectives and goals (e.g., reduction in the rate of diabetes in the general population)

The type(s) of measures identified will inform the evaluation plan and data collection procedures in support of evaluation.

In order to ensure that performance results from OMH-funded projects are linked and contribute to program-wide, OMH-wide, and *Healthy People 2010* objectives and goals, <u>all</u> OMH grantees must include performance measures from the set provided at **Appendix 5**. In addition to the six core measures specified by OMH for all grantees, grantees should select two optional measures from the list. Depending upon the nature of the funded activities and other desired results, OMH grant applicants may develop and include additional measures.

Step 4: Tie Outcomes/Impacts and Measures to Long-Term Objectives and Goals

Effectively addressing racial and ethnic minority health problems and systems approaches to such problems supports the two principal goals of *Healthy People 2010 (HP2010)*: (1) to increase the quality and years of healthy life, and (2) to eliminate health disparities. The results of OMH-funded projects and activities must, therefore, contribute to relevant grant program-specific, OMH-wide, and *HP2010* objectives and priorities—which, in turn, contribute to the long-term *HP2010* goals. Consistent with information provided in Step 1 to show the relationship between proposed project activities with grant program, OMH, and *HP2010* objectives and priorities, grant applicants should identify and describe how the outcomes, impacts, and performance measures for their proposed efforts will contribute to relevant program, OMH, and *HP2010* objectives and goals.

Step 5: Develop a Logic Model for the Proposed Project and Activities

A logic model is simply a tool, often used by program planners and evaluators, to help identify planned activities for the program, and how such activities relate to the problem being addressed and the anticipated results. Logic models can be very useful in clarifying the "logic" behind what is being done and how programs should work. The University of Wisconsin-Extension web site at http://www1.uwex.edu/ces/lmcourse is an excellent resource for more information on logic models. Other logic model planning resources and guidance are also available at:

- http://www.uidaho.edu/extension/LogicModel.pdf
- http://www.wkkf.org/Pubs/Tools/Evaluation/Pub3669.pdf
- http://www.cdc.gov/eval/resources.htm#logic%20model

In order to ensure a rational approach to OMH-funded grant efforts that will clearly link grant activities to broader program- and OMH-wide objectives and goals, each grant applicant is expected to develop and submit a logic model for the proposed project and activities. Such a logic model should be able to guide subsequent plans for collecting data on and evaluating the project and activities to determine whether expected impacts/outcomes have, in fact, been achieved. Examples of a logic model template, logic model worksheet, and a completed logic model for broad-based diabetes activities are provided for this purpose (see **Appendices 6, 7, and 8**).

Step 6: Obtain Appropriate Evaluation Expertise and Determine Evaluation Methods and Design

- Involve individuals who know about evaluation, the community, and the project.—Grant applicants should include individuals on their project teams with expertise to identify and select the evaluation methods and design needed to determine whether expected results have been achieved. Good evaluators will also be able to help with:
 - o the development of the logic models themselves,
 - o identification and selection of evaluation methods and design,
 - o data collection methods appropriate for the evaluation,
 - o design of data collection procedures and forms, and
 - o analysis and reporting of the results.

Some grant applicants may wish to enlist external evaluators for this purpose. Local colleges and universities with faculty, staff, and graduate students who are engaged in academic research are often good sources for such expertise. However, it is critical for such individuals and/or other members of the project team to also have knowledge and experience with the populations and health issues being addressed. In addition to trained evaluators or researchers, involvement of project participants and practitioners will help ensure that the evaluation is informed by those who have first-hand knowledge about the project and its participants as well as a stake in the project and its outcome. If interviews or surveys will be conducted, persons who understand the culture and who speak the language of the target population may also need to be included. The purpose of the evaluation expertise is to help grantees, the project team as a whole, and, ultimately, OMH, produce meaningful results of the project(s) and program(s) being funded.

• Identify evaluation methods and design.—Different types of evaluation methods and designs are available for assessing the effectiveness of parts and/or all of the proposed project or program. There are benefits and drawbacks to each type of method and design. Working with individuals who have the needed expertise, grant applicants should identify the proposed evaluation methods and design for determining the effectiveness of the strategies, interventions, and activities to be funded. A list of the types of evaluation methods generally used is provided in Appendix 9.

Step 7: Develop Data Collection Plan, Protocols and Forms Needed to Implement the Evaluation

• Develop Data Collection Plan.--Once the evaluation design, methods, and measures for assessing program/project results (outcomes/impacts) are clear, the kinds of data to be collected and analyzed—and a plan for such collection and analysis—can be determined. A data collection plan specifies in precise, clear, and unambiguous terms the data that must be collected, the frequency of collection, the instruments for collection, the sources of the data, the location of the data, and who will be responsible for collecting the data. This plan should assist in organizing and coordinating the data collection process. The kind of data to be collected may differ considerably from activity to activity, and the data source(s) selected will depend on the kinds of measures selected and the relative feasibility of obtaining the needed data. Data can be obtained from a variety of sources (such as, state agencies, hospitals, community health centers, program or project staff, etc.), and through a variety of means, including surveys or instruments administered to patients, trainees, health care

providers, and other populations targeted or participating in planning and implementation of project activities. In the diabetes example, one of the measures is the "number/percent of individuals with increased awareness and knowledge," for which an appropriate source of this information may be the participants themselves who received an educational or training intervention. (See **Appendix 10** for a sample data collection plan template and a completed plan based on the diabetes example.)

Grant awardees will be expected to implement their evaluation and data collection plans at the beginning of their projects, in order to capture and document activities and actions contributing to relevant project impacts/outcomes.

- <u>Develop Data Collection Procedures and Forms.</u>—Standard forms, questionnaires, other
 instruments, and databases—as well as standard procedures for using such tools, and staff
 training on these procedures—will facilitate the systematic data collection needed to
 effectively implement the data collection plan and conduct the requisite evaluation of
 program or project activities. These tools may include, but are not limited to:
 - Activity records or tracking forms. These forms document the activities conducted and provide the basis for assessing connections between the program or project and its impacts/outcomes. The recording and tracking of basic process data is often necessary in order to evaluate all activities.
 - Outcome/impact data collection procedures and forms. Based on the selected outcomes/impacts and performance measures to be used, forms need to be developed and a database (e.g., Microsoft ACCESS) established for recording and storing performance- or results-oriented data. Relevant forms may include, for example, surveys/questionnaires used to assess knowledge and attitudes before and after a program/project intervention, or forms that record changes in organizational linkages or services provided as a result of a community coalition.

Appendix 11 includes some examples of data collection forms for recording processes and outcomes of a few sample activities. In the diabetes example, the types of data that might be collected include: educational sessions conducted, number of people trained, evidence of change in awareness or knowledge, records of strategic planning documents and other products produced by community-based task forces, etc.

CONCLUSION

Upon award, additional steps will be needed by grantees to implement the evaluation plan, including training program/project staff to follow data collection protocols, enter data, analyze data, prepare reports, and submit data and disseminate reports to OMH and others, as appropriate. Grantees need not include information about these steps in the evaluation plan at this time. However, by following the steps outlined above, OMH grant applicants and other users will be guided through a careful evaluation planning process designed to increase the ability of OMH-funded activities to produce meaningful results in return for the public's investment in OMH's grant programs and other efforts. The ultimate goal is to improve the health and well-being of racial and ethnic minorities in the U.S.; reduce and, ultimately, eliminate the disparate burden of preventable disease, disability and premature death on such populations; and facilitate systems approaches to addressing these problems.

Appendix 1: Glossary of Terms

GLOSSARY OF TERMS

For reference, the following is a brief glossary of terms used in the *Evaluation Protocol*:

Best practices: Program models or activities for which effectiveness in achieving specified goals or objectives has been demonstrated or suggested, across a number of implementations and evaluations.

Cost-Benefit Analysis: A process of measuring the expected cost of an effort or action against the expected benefit in order to evaluate the desirability of the effort.

Cost-Effectiveness Analysis: A comparison of the relative costs and benefits of two or more approaches to a problem.

Evaluability Assessment: A systematic process used to determine the feasibility of a program evaluation. It also helps determine whether conducting a program evaluation will provide useful information that will help improve the management of a program and its overall performance.

Evidence-based: Based on scientific evidence or the best possible knowledge that is available.

Experimental design: Individuals in the target population are randomly assigned to an experimental group receiving the intervention (project activities) or a control group that does not receive the intervention, and data are collected from both groups throughout the project. The overwhelming benefit of experimental designs is the ability to attribute the cause of the observed changes in the experimental group to the intervention rather than to something else. Because of random assignment to the two groups, the two groups are assumed to be equal in all relevant characteristics except the presence of the intervention. This "randomized controlled trial" produces stronger evidence, but it can be expensive and potentially difficult to implement in a community setting.

Formative evaluation: Typically conducted during the development (or formation) of a strategy, program, or product (including trained personnel) to assess (or 'test') their strengths and weaknesses before implementation. Such evaluations permit necessary revisions and improvements that enable planned efforts to be tailored to the target audience(s), as in the case of campaign strategies, products, or messages that are 'pre-tested' by a small group before they are implemented on a large scale. They can also be used for observing, monitoring, and providing feedback on student, staff, or trainee performance to improve skills. The basic purpose is to maximize the chance for program, project, or trainee success before full implementation of the activity starts. Unlike summative evaluations, formative evaluations are primarily prospective, shape program/project direction, and provide feedback towards improvement. Examples of formative evaluations are needs assessments, evaluability assessments, and process evaluations.

Goals: Broad statements (i.e., written in general terms) that convey a program's overall intent to change, reduce, or eliminate the problem described. Goals identify the program's intended short-and long-term results.

Impact evaluation: Focuses on the long-range results of the program or project, and changes or improvements as a result (for e.g., long-term maintenance of desired behavior, reduced absenteeism from work, reduced morbidity and mortality). Because such evaluations are the most comprehensive and focus on long-term results of the program and changes or improvements in health status, they are the most desirable. However, impact evaluations are rarely possible because they are frequently costly and involve extended commitment. Also, the results often cannot be directly related to the effects of a program, project, or activity because of other (external) influences on the target audience, which occur over time.

Impact Measure: A measure of the direct or indirect long-term effects or consequences of the outcomes (in terms of overall effectiveness or efficiency), resulting from achieving program or project objectives and goals (e.g., reduction in the rate of diabetes in the general population).

Input Measure: A measure of what an agency or manager has available (e.g., funding, staff, facilities or equipment, supplies, etc.) to carry out the program or activity to produce an output or outcome.

Logic model: A tool for planning, implementing, and evaluating programmatic efforts, by mapping out the theory or rationale that supports what is being done. Logic models typically tie together: long-term problem(s) to be addressed; factors that must be addressed that contribute to the problem(s); strategies and practices, and supporting resources, that can be mobilized to address the factors and the problems; and measurable impacts and outcomes that can be expected to result from implementing the strategies and practices – as these relate to the long-term problem(s).

Meta-Analysis: A technique for summarizing and reviewing research on a topic.

Needs Assessment: A method of collecting information on the needs, wants, and expectations of a community or other group of people to gain a picture of the strengths and weaknesses of a community and to plan programming and allocate resources.

Non-experimental design: Only one group receiving the intervention is being observed or studied without the use of a comparison group to control for outside factors. Thus, such designs generally involve less data collection and are easier to plan and carry out. They typically involve observing and/or collecting all relevant data–including data on key performance measures–on participants at selected points in time during the project. Examples of such design include, but are not limited to, case studies, structured interviews, surveys, pre-/post-tests, ethnographic studies, and document reviews (e.g., medical records, intake and discharge forms). Because non-experimental designs have only one group, they are infrequently used to evaluate whether particular interventions are effective in producing specified outcomes, because causality (i.e., whether outcomes are the result of the intervention) cannot be established. However, if conducted properly, this type of design can be just as informative as the two previously discussed designs.

Objectives: Are derived from the program goals and explain how the program goals will be accomplished. Objectives are well-defined, specific, quantifiable statements of the program's

desired results and they should include the target level of accomplishment, thereby further defining goals and providing the means to measure program performance.

Outcome evaluation: Used to obtain descriptive data on a program or project and to document (typically) short- and intermediate-term results. Task-focused results are those that describe the output of the activity (e.g., the number of public inquiries received as a result of a public service announcement). Shorter-term results describe the immediate effects of the project on the target audience (e.g., percent of the target audience showing increased awareness of the subject). Information from such evaluation can show results such as knowledge and attitude changes, short-term or intermediate behavior shifts, and policies initiated or other institutional changes.

Outcome Measure: A measure of an event, occurrence, condition, or result of a program or project that indicates achievement of objectives and goal(s); this type of measure is used to measure the success of a program, project, or system (e.g., the percentage of people who do not get influenza).

Output Measure: A measure of a product, service, or result of a particular activity (e.g., number of people vaccinated with the influenza vaccine, number of personnel trained; number of phone calls processed by the OMH Resource Center); this type of measure provides information about the activity, not the success in achieving the objectives and goals of the program/project.

Performance measures/performance indicators: Particular values used to measure program activities, impacts and outcomes. They represent the actual data/information that will be collected at the program level to measure the specific activities/impacts/outcomes a program is designed to achieve. Therefore, they must be developed for each program objective.

Process evaluation: Examine the tasks and procedures involved in implementing a program or activities, including the administrative and organizational aspects of, and delivery procedures involved in, the efforts. Such evaluations enable monitoring to ensure feedback during the course of the program or project.

Process Measure: A measure of the procedures, tasks, or processes involved in implementing program or project activities to produce an output or outcome (e.g., availability of trained medical interpreters at the time of a doctor's visit by a patient with limited English proficiency).

Program: A group of individual (grantee) projects, unified by a set of goals, health issues of focus, recommended types of activities, eligible grant recipients, etc.

Project: An individual project (grantee), usually within an overall program, addressing one or more specific target populations or communities, and health issues.

Quasi-experimental design: Data are collected and compared over the course of the project between an experimental group receiving the intervention (project activities) and a similar population (control or comparison group) not receiving the intervention. This can help assess whether the intervention was responsible for impacts/outcomes, even though it will not be as rigorous as a randomized controlled trial. A quasi-experimental design is usually more feasible

than the experimental approach, and is ideal when randomization is not possible or is not appropriate.

Statistical significance: When the analysis of data results in statistical significance, it means that the result is not likely to have occurred by chance. It confirms a relationship or difference between variables.

Summative evaluation: Look at a combination of measures and conclusions for larger patterns and trends in performance, to assess, in summary, whether the program or project overall did what it was designed to do. Compared to formative evaluations, summative evaluations are primarily retrospective, document evidence, and show results and achievement. Examples of summative evaluations include outcome and impact evaluations, cost-effectiveness and cost-benefit analyses, and meta-analyses (which integrate outcomes from multiple studies to determine an overall judgment or summary conclusion about a particular research or evaluation question).

Uniform Data Set (UDS): A systematic data reporting system recently developed for all OMH-funded activities that organizes data collection and reporting by type of activity conducted. The UDS is an Internet-based system.

Appendix 2: Types & Sources of Data

Examples of Types & Sources of Data to Guide Planning

The following types and sources of data may be useful in describing racial/ethnic minority health or systems problems, and factors contributing to such problems:

- **Demographic data:** These data can provide information on certain population characteristics within a State, Tribal area, or region, such as race, ethnicity, gender, age, geographic location, education, income, and primary language spoken at home (i.e., English vs. another language). Demographic data can be obtained from the U.S. Census at www.census.gov. These data can help answer questions about the racial/ethnic minority populations in a particular State, region, or community.
- Population and community health data: Excellent Federal sources for national, and in some cases, State or local health data, include the CDC "Wonder" system at wonder.cdc.gov, the Morbidity and Mortality Weekly Report data at www.cdc.gov/mmwr, and data from the National Center for Health Statistics (reported from States) at www.cdc.gov/nchs/data. Racial/ethnic minority health data can be accessed at such sites as www.hhs-stat.net/omh or, by State, at Kaiser Family Foundation's www.statehealthfacts.org, or from national minority health organizations. State Health Departments and State Offices of Minority Health are also good sources for data about the populations in their jurisdictions. In addition, Inter-Tribal Council Epidemiology Centers are designed to provide access to health data for member tribes. These data can help answer questions about the key health problems and risk factors for the selected populations.
- Systems data: This category refers to information on the kinds of broad systems characteristics that might promote or inhibit the ability to address racial/ethnic minority health problems in a State, other geographic area, or organization (e.g., whether infrastructure and staff are available to address identified problems; whether strategic plans have been developed to guide progress towards goals and objectives; whether task forces or other coordinating bodies exist to identify and pool resources, expertise, and other talent; whether data/information and communication systems support needed functions; whether services provided are client-, patient-, or user-centered, etc. These systems characteristics go beyond health care or public health systems alone. Such information may be found through the websites of State health departments and other health-oriented task forces or organizations (e.g., the California Wellness Foundation). The Association of State and Territorial Health Officials has links for health departments in every state at http://www.astho.org/index.php?template=regional_links.php. The Kaiser Family Foundation has a set of state government links including links to health departments at http://www.statehealthfacts.org/cgi-bin/healthfacts.cgi?action=profile. These data may help answer questions about key systems issues that have an impact on the health of selected populations.
- Health care coverage, access, and utilization data: One Federal source for such data is the Agency for Healthcare Research and Quality's (AHRQ's) Healthcare Cost and Utilization Project (HCUP) Databases, at www.ahrq.gov/data/hcup. This particular site includes State-level data, though such data vary in terms of what is reported. The Centers for Medicare and Medicaid Services (CMS) is another Federal source of data, particularly on enrollees in Medicare, Medicaid, and the State Children's Health Insurance Programs, at www.cms.hhs.gov/home/rsds.asp. State departments of public health may also have data on health insurance coverage within the State. In addition, the Commonwealth Fund at http://www.cmwf.org/ tracks trends in health coverage, access and quality and provides data on State health policy and underserved populations. These data can help answer questions about the nature and extent of health care access and usage for selected population(s).

Appendix 3: Priority *Healthy People 2010* Objectives

Selected *Healthy People 2010* Objectives of Particular Relevance to Racial/Ethnic Minority Health and Systems-Related Priorities

Focus Area: Access to Quality Health Services

- Increase the proportion of persons with health insurance* (1.1)
- Increase in counseling on health behaviors among persons at risk with a physician visit in the past year physical activity or exercise (adults aged 18 years and older), diet and nutrition (adults aged 18 years and older), smoking cessation (adult smokers aged 18 years and older), risky drinking (adults aged 18 years and older), unintended pregnancy (females aged 15 to 44 years), prevention of sexually transmitted diseases (males aged 15 to 49 years; females aged 15 to 44 years), and management of menopause (females aged 45 to 57 years) (1.3a-d, f-h)
- Increase the proportion of persons who have a specific source of ongoing care* (1.4)
- Increase the proportion of persons with a usual primary care provider* (1.5)
- Reduce the proportion of families that experience difficulties or delays in obtaining health care or do not receive needed care for one or more family members* (1.6)
- Reduce hospitalization rates for three ambulatory-care-sensitive conditions pediatric asthma, uncontrolled diabetes, and immunization-preventable pneumonia and influenza (1.9)

Focus Area: Cancer

- Increase the proportion of physicians and dentists who counsel their at-risk patients about tobacco use cessation, physical activity, and cancer screening internists who counsel about smoking cessation, family physicians who counsel about smoking cessation, primary care providers who counsel about blood stool tests, primary care providers who counsel about proctoscopic examinations, primary care providers who counsel about mammograms, primary care providers who counsel about physical activity (3.10a-h)
- Increase the proportion of women (aged 18 years and older) who receive a Pap test within the preceding 3 years* (3.11b)
- Increase the proportion of adults who receive a colorectal cancer screening examination* (3.12)
- Increase the proportion of women aged 40 years and older who have received a mammogram within the preceding 2 years* (3.13)

Focus Area: Diabetes

- Increase the proportion of persons with diabetes who receive formal diabetes education* (5.1)
- Increase the proportion of adults with diabetes whose condition has been diagnosed (5.4)
- Increase the proportion of adults with diabetes who have a glycosylated hemoglobin measurement at least once a year (5.12)
- Increase the proportion of adults with diabetes who have an annual dilated eye examination (5.13)

Note: An * and blue text together indicate *HP2010* objectives that are not making progress. *Italicized* phrases are revisions based on the *HP2010 Midcourse Review*. More information on these objectives is available at www.healthypeople.gov.

- Increase the proportion of adults with diabetes who have at least an annual foot examination (5.14)
- Increase the proportion of adults with diabetes who perform self-blood-glucose monitoring at least once daily* (5.17)

Focus Area: Educational and Community-Based Programs

- Increase the proportion of middle, junior high, and senior high schools that provide school health education to prevent health problems in the following areas: unintentional injury; violence; suicide; tobacco use and addiction; alcohol and other drug use; unintended pregnancy, HIV/AIDS, and STD infection; unhealthy dietary patterns; inadequate physical activity; and environmental health (7.2)
- Increase the proportion of college and university students who receive information from their institution on each of the six priority health-risk behavior areas (7.3)
- Increase the proportion of worksites that offer a comprehensive employee health promotion program to their employees (7.5)
- Increase the proportion of employees who participate in employer-sponsored health promotion activities* (7.6)

Focus Area: Environmental Health

- Reduce the proportion of persons exposed to air that does not meet the U.S. Environmental Protection Agency's health-based standards for harmful air pollutants* (8.1)
- Eliminate elevated blood lead levels in children (8.11)

Focus Area: Heart Disease and Stroke

- Increase the proportion of eligible persons with witnessed out-of-hospital cardiac arrest who receive their first therapeutic electrical shock within 6 minutes after collapse recognition (12.5)
- Increase the proportion of adults with high blood pressure who are taking action (for example, losing weight, increasing physical activity, or reducing sodium intake) to help control their blood pressure (12.11)
- Increase the proportion of adults who have had their blood pressure measured within the preceding 2 years and can state whether their blood pressure was normal or high* (12-12)

Focus Area: HIV

- Increase the proportion of substance abuse treatment facilities that offer HIV/AIDS education, counseling, and support (13.8)
- Increase the proportion of HIV-infected adolescents (aged 13 years and older) and adults who receive testing, treatment, and prophylaxis consistent with current Public Health Service treatment guidelines (13.13)

Focus Area: Immunizations

- Increase the proportion of all tuberculosis patients who complete curative therapy within 12 months (14.12)
- Increase the proportion of persons with latent tuberculosis infection who complete a course of treatment (14.13)
- Increase the proportion of all tuberculosis patients who complete curative therapy within 12 months* (14.22)
- Increase the proportion of adults who are vaccinated annually against influenza* (14.29)
- Increase the proportion of adults who are ever vaccinated against pneumococcal disease* (14.29)

Focus Area: Injury and Violence Prevention

- Increase use of safety belts. (15.19)
- Increase the percentage of motor vehicle occupants aged 4 years and under who used child restraints (15.20)

Focus Area: Maternal, Child, and Infant Health

- Increase the proportion of pregnant women who receive early and adequate prenatal care* (16.6a)
- Increase the percentage of healthy full-term infants who are put down to sleep on their backs (16.13)
- Increase abstinence from alcohol, cigarettes, and illicit drugs among pregnant women* (16.17)

Focus Area: Mental Health

• Increase the proportion of adults with mental disorders who receive treatment — serious mental illness, recognized depression, schizophrenia, and generalized anxiety disorder (18.9)

Focus Area: Nutrition and Overweight

- Increase the proportion of persons aged 2 years and older who consume at least two daily servings of fruit (19.5)
- Increase the proportion of persons aged 2 years and older who consume at least three daily servings of vegetables, with at least one-third being dark green or orange vegetables (19.6)
- Increase the proportion of persons aged 2 years and older who consume less than 10 percent of calories from saturated fat (19.8)
- Increase the proportion of persons aged 2 years and older who consume no more than 30 percent of calories from total fat (19.9)
- Increase the proportion of worksites that offer nutrition or weight management classes or counseling (19.16)
- Increase the proportion of physician office visits made by patients with a diagnosis of cardiovascular disease, diabetes, or hyperlipidemia that include counseling or education related to diet and nutrition.* (19.17)

Note: An * and blue text together indicate *HP2010* objectives that are not making progress. *Italicized* phrases are revisions based on the *HP2010 Midcourse Review*. More information on these objectives is available at www.healthypeople.gov.

Focus Area: Physical Activity and Fitness

- Reduce the proportion of adults who engage in no leisure-time physical activity*
 (22.1)
- Increase the proportion of adults who engage in moderate physical activity for at least 30 minutes per day 5 or more days per week or vigorous physical activity for at least 20 minutes per day 3 or more days per week* (22.2)
- Increase the proportion of adults who engage in vigorous physical activity that promotes the development and maintenance of cardiorespiratory fitness for at least 20 minutes per day 3 or more days per week* (22.3)
- Increase the proportion of adolescents who engage in moderate physical activity for at least 30 minutes *per day* on 5 *or more* days per week. (22.6)
- Increase the proportion of adolescents who engage in vigorous physical activity that promotes cardiorespiratory fitness 3 or more days per week for 20 or more minutes per occasion* (22.7)
- Increase the proportion of the Nation's public and private schools that require daily physical education for all students (22.8)
- Increase the proportion of adolescents who view television 2 or fewer hours on a school day (22.11)
- Increase the proportion of worksites offering employer-sponsored physical activity and fitness programs (22.13)

Focus Area: Public Health Infrastructure

- Increase the proportion of population-based *Healthy People 2010* objectives for which national data are available for all population groups identified for the objective. (23.4)
- Increase the proportion of Tribal, State (*includes the District of Columbia*), and *local health agencies* that have *implemented* a health improvement plan and increase the proportion of local *health* jurisdictions that have implemented a health improvement plan linked with their State plan (23.12)

Focus Area: Respiratory Diseases (Asthma Only)

- Increase the proportion of persons with asthma who receive formal patient education, including information about community and self-help resources, as an essential part of the management of their condition* (24.6)
- Increase the proportion of persons with asthma who receive appropriate asthma care according to the NAEPP Guidelines* (24.7)

Focus Area: Tobacco Use

- Reduce tobacco use by adults tobacco products, cigarettes, and spit tobacco*
 (27.1a-c)
- Reduce tobacco use by adolescents tobacco products, cigarettes, spit tobacco, cigars, and *bidis** (27.2)
- Reduce the proportion of nonsmokers exposed to environmental tobacco smoke (27.10)

Note: An * and blue text together indicate *HP2010* objectives that are not making progress. *Italicized* phrases are revisions based on the *HP2010 Midcourse Review*. More information on these objectives is available at www.healthypeople.gov.

- Increase smoke-free and tobacco-free environments in schools, including all school facilities, property, vehicles, and school events (27.11)
- Increase the proportion of *persons covered by indoor worksite policies that prohibit smoking** (27.12)
- Establish laws on smoke-free indoor air that prohibit smoking in public places and worksites (27.13)
- Reduce the illegal sales rate to minors through enforcement of laws prohibiting the sale of tobacco products to minors (27.14)
- Reduce the proportion of adolescents and young adults who are exposed to tobacco advertising and promotion* (27.16)
- Increase the number of States and the District of Columbia, *Territories, and Tribes with sustainable* and comprehensive evidence-based tobacco control programs. (27.18)

Appendix 4: Racial/Ethnic Minority-Specific Healthy People 2010 Objectives for which Progress Towards the Targets is Needed

Appendix 5: OMH Performance Measures

OMH Performance Measures for Grantees

In order to ensure that performance results from OMH-funded projects are linked and contribute to program-wide, OMH-wide, and *Healthy People 2010* objectives and goals, a set of performance measures for <u>all</u> OMH grantees is provided below:

Measures for All OMH Grantees

- Number of Healthy People 2010 objectives for priority racial/ethnic minority health and systems issues (as specified by OMH) that are being addressed by the OMH grantee (see OMH list)
- Number of measurable, racial/ethnic minority-specific Healthy People 2010
 objectives and subobjectives that have not made progress towards or are moving
 away from their targets that are being addressed by the OMH grantee (see OMH
 furnished Excel tables)
- Number of individuals (unduplicated) participating in OMH-funded, grant program activities per year
- Number and percent of individuals with increased awareness and knowledge of racial/ethnic minority health problems and how to address such problems as a result of OMH-funded program participation
- Number of racial/ethnic minority health improvement- and/or health disparitiesrelated strategic plans developed to facilitate leadership and organizational effectiveness
- Number of partnerships facilitated and/or established to enhance coordination and collaboration on racial/ethnic minority health/health disparities problems

Optional Measures (Each Grantee Must Choose at Least 2)

- Number of full-time equivalents (FTEs) on program/project staff supported with OMH funding
- Number of OMH-supported training and technical assistance events
- Number and percent of individuals trained through OMH-supported activities
- Change in number of limited-English-proficient individuals with usual source of health care that offers language assistance as a result of OMH-funded activities
- Percent of racial/ethnic minority adult patients with improved experiences of care as a result of OMH-funded activities
- Percent of racial/ethnic minority hospital patients who have good communications with doctors or nurses as a result of OMH-funded activities
- Number of persons who participated in OMH grantee-facilitated or -supported "pipeline" programs to increase racial/ethnic minority representation in the public health, health care, and/or research workforce
- Number of "best" or "evidence-based" strategies & practices identified as a result of OMH-funded efforts

OMH grantees may develop and include additional measures depending upon the nature of the funded activities and desired results.

Appendix 6: Logic Model Template

Logic Model Template

Complete each block with the appropriate, program-specific text

Project Name: Long-Term Problem(s): Long-Term Contributing Strategies **Outcomes and Impacts** Objectives **Factors** and Practices and Goals Performance Measures

Appendix 7: Logic Model Worksheet & Example

LOGIC MODEL WORKSHEET

The logic model should lay out the logical relationship between the program's objectives, activities, impacts and outcomes. It is a description of what the program will do and how the program will work to improve racial/ethnic minority health and eliminate racial/ethnic minority health disparities.

Project Name			
Overall Health Problem(s) to be Add	lressed		
Long-Term Problem(s):			
Long-Term Objectives and Goals: _			
•			

CONTRIBUTING	ACTIVITIES	OUTCOMES AND	PERFORMANCE MEASURES				
FACTORS	IMPACTS		Measures for All Grantees	*Optional Measures			

^{*} Grantees need to select at least 2 optional OMH measures that apply to their activities and objectives.

LOGIC MODEL WORKSHEET EXAMPLE: DIABETES PROJECT

The logic model should lay out the logical relationship between the program's objectives, activities, and impacts/outcomes. It is a description of what the program will do and how the program will work to improve racial/ethnic minority health and eliminate racial/ethnic minority health disparities.

Project Name: Community Programs to Improve Minority Health **Overall Health Problem(s) to be Addressed:** Diabetes

Long-Term Problem(s): High rate of preventable morbidity and premature mortality in relation to diabetes

Long-Term Objectives and Goals: Reduce prevalence of diabetes in minorities

CONTRIBUTING	ACTIVITIES	OUTCOMES AND	PERFORMANCE N	MEASURES
FACTORS	ACTIVITIES	IMPACTS	Measures for All Grantees	*Optional Measures
Lack of awareness and knowledge about the connections between diet, exercise, obesity, and diabetes Lack of public awareness about risk factors related to diabetes Lack of community assets, such as healthy food choices in local grocery stores and restaurants Lack of safe venues to engage in physical activity, sports, and recreation Lack of strategic planning to guide leadership action and assess progress towards established diabetes prevention and management objectives and goals Lack of language assistance services in health care settings to minimize systems barriers to access and utilization for limited-English-proficient individuals at risk for diabetes	Providing individually-oriented health education through tailored channels (e.g., health providers or faith-based organizations) Providing community-based health education or communication campaigns through local media channels, schools, and community organizations Establishing partnerships among local leaders in the restaurant, grocery, and exercise/fitness industries, local health and city officials, and representatives of communities at risk for diabetes Development and implementation of a strategic plan that identifies diabetes prevention and management as a priority, and sets benchmarks and targets to guide action towards established objectives and goals that can strengthen leadership effectiveness Introduction of linguistically appropriate services, such as properly translated written materials and medical interpreters during clinical encounters to promote health care access and utilization for limited English proficient patients who may be at risk for or have diabetes and to provide user-centered care	Increased awareness/knowledge about the link between diet, exercise, obesity, and diabetes Increased healthcare provider skills in educating and counseling their patients about diabetes prevention, treatment, and management Increased patient adherence to prescribed diet, exercise, and treatment regimens for diabetes Increased public awareness about diabetes and related risk factors Increased plans and policies that promote healthier dietary choices and safe places for exercise and sports in the community Increased system design characteristics to minimize barriers for racial/ethnic minority users, such as the provision of trained medical interpreters or bilingual health care providers to facilitate health care access and use by limited-English-proficient patients with diabetes	Number of diabetes-related HP2010 objectives addressed, e.g. proportion of adults with diabetes whose condition has been diagnosed, proportion of adults with diabetes who have an annual dilated eye examination, proportion of adults with diabetes who have at least an annual foot examination Number of diabetes-related HP2010 objectives addressed that are not making progress, e.g. proportion of persons with diabetes who receive formal diabetes education, proportion of adults with diabetes who perform self-blood-glucose monitoring at least once daily Number of individuals (unduplicated) participating in OMH-funded diabetes activities per year Number/percent of individuals with increased awareness and knowledge of diabetes and how to address it as a result of OMH-funded program participation Number of strategic planning documents developed Number of partnerships to enhance coordination and collaboration on diabetes treatment and control	Number of training and TA events Number of evidence-based practices on diabetes treatment and control identified to inform planning and evaluation of minority health/health disparities efforts and systems approaches

^{*} Grantees need to select at least 2 optional OMH measures that apply to their activities and objectives.

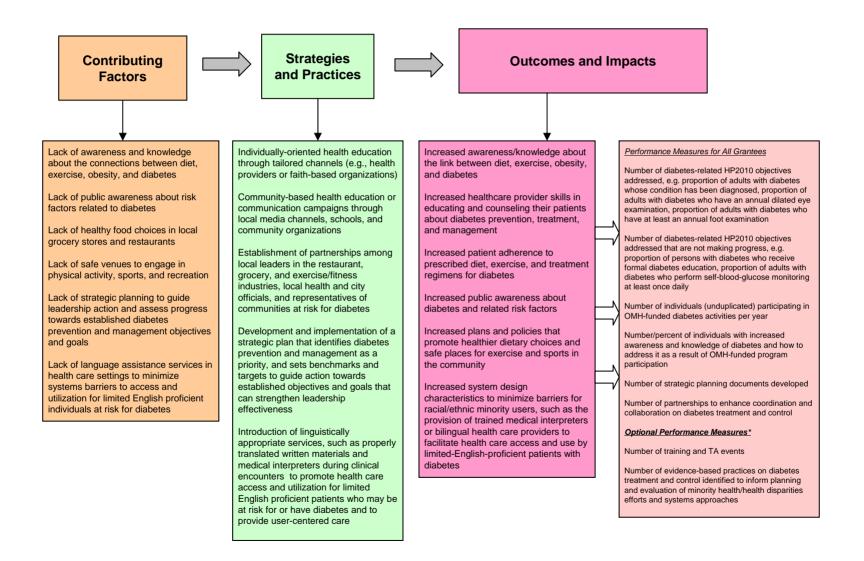

Appendix 8: Completed Logic Model

Logic Model Example - Diabetes

Project Name: Community Programs to Improve Minority Health

Long-Term Problem: High rate of preventable morbidity and premature mortality in relation to diabetes

Long-Term Objectives and Goals: Reduce prevalence of diabetes in minorities

^{*}Grantees need to select at least 2 optional OMH measures that apply to their activities and objectives.

Appendix 9: Types of Evaluation Methods

TYPES OF EVALUATION METHODS

Generally, the types of evaluation methods used to provide information to program/ project managers, staffs, funders, and other stakeholders about the results of their efforts are categorized as process, outcome, or impact evaluations and formative or summative evaluations—described briefly below:

- ❖ Process evaluations examine the tasks and procedures involved in implementing a program or activities, including the administrative and organizational aspects of, and delivery procedures involved in, the efforts. Such evaluations enable monitoring to ensure feedback during the course of the program or project.
- Outcome evaluations are used to obtain descriptive data on a program or project and to document (typically) short- and intermediate-term results. Task-focused results are those that describe the output of the activity (e.g., the number of public inquiries received as a result of a public service announcement). Shorter-term results describe the immediate effects of the project on the target audience (e.g., percent of the target audience showing increased awareness of the subject). Information from such evaluation can show results such as knowledge and attitude changes, short-term or intermediate behavior shifts, and policies initiated or other institutional changes.
- Impact evaluations focus on the long-range results of the program or project, and changes or improvements as a result (e.g., long-term maintenance of desired behavior, reduced absenteeism from work, reduced morbidity and mortality). Because such evaluations are the most comprehensive and focus on long-term results of the program and changes or improvements in health status, they are the most desirable. However, impact evaluations are rarely possible because they are frequently costly and involve extended commitment. Also, the results often cannot be directly related to the effects of a program, project, or activity because of other (external) influences on the target audience, which occur over time.
- ❖ Formative evaluations are typically conducted during the development (or formation) of a strategy, program, or product (including trained personnel) to assess (or 'test') their strengths and weaknesses before implementation. Such evaluations permit necessary revisions and improvements that enable planned efforts to be tailored to the target audience(s), as in the case of campaign strategies, products, or messages that are 'pre-tested' by a small group before they are implemented on a large scale. They can also be used for observing, monitoring, and providing feedback on student, staff, or trainee performance to improve skills. The basic purpose is to maximize the chance for program, project, or trainee success before full implementation of the activity starts. Unlike summative evaluations, formative evaluations are primarily prospective, shape program/project direction, and provide feedback towards improvement. Examples of formative evaluations are needs assessments, evaluability assessments, and process evaluations.
- ❖ Summative evaluations look at a combination of measures and conclusions for larger patterns and trends in performance, to assess, in summary, whether the program or project overall did what it was designed to do. Compared to formative evaluations, summative evaluations are primarily retrospective, document evidence,

and show results and achievement. Examples of summative evaluations include outcome and impact evaluations, cost-effectiveness and cost-benefit analyses, and meta-analyses (which integrate outcomes from multiple studies to determine an overall judgment or summary conclusion about a particular research or evaluation question).

Knowledge Assessment Survey

Training Program for Community Health Workers: Awareness and Knowledge of Diabetes Diagnosis, Treatment, and Prevention

KNOWLEDGE EVALUATION					
1. Which three of the following are clinical tests that can be used as preventive measures for diabetic patients?					
 A. Glycosylated hemoglobin measurement B. Annual dilated eye exam C. Pelvic exam D. Annual foot exam E. Periodontal exam 					
2. Please identify two diabetes related HP 2010 objectives that are not making progress.					
3. Which of the following are common symptoms of diabetes?					
A. Weight lossB. Lower back painC. ThirstinessD. Blurred visionE. Diarrhea					
4. Please identify two things people can do to reduce their risk for obesity and diabetes.					
5. What is BMI and how do you calculate it?					

Appendix 12: Frequently Asked Questions

Frequently Asked Questions on Evaluation Planning

1. What is evaluation?

Evaluation is a way of assessing how well a program, project, or some other activity is achieving or has achieved its objectives.

2. Why is evaluation important?

Good evaluation enables program/project managers and staffs, program administrators, funders, policymakers, and others to know whether their efforts are effectively accomplishing desired or expected results. With such knowledge, program and project activities can be adjusted and improved to better serve clients and communities, scarce resources can be used more effectively and efficiently, and results of challenges and accomplishments can be shared with others so that everyone can learn about and from their experiences. Without evaluation, it cannot be determined in a meaningful way whether a program, project, or activity is succeeding or failing and why.

3. Why is OMH requiring evaluation?

The Government Performance and Results Act of 1993 (GPRA) requires that Federal programs provide information about program goals, performance relative to program goals, and results regarding program effectiveness and cost efficiency in the spending of Federal funds. When OMH grantees are able to produce documented results showing how strategies and activities being funded contribute to OMH's objectives and goals, they support OMH's ability to comply with GPRA and demonstrate "returns on the investment" in the Office's grant programs. This further enables OMH to justify continued support for its grant programs and grantee efforts.

4. Are the steps and components outlined in OMH's evaluation planning guidelines required?

OMH's evaluation planning guidelines consist of very basic evaluation steps for developing an effective evaluation plan. The guidelines were developed to help grant applicants improve the evaluation plans submitted as part of their grant applications. The fact that review of these plans is a part of the grant award decision-making process – and comprises 25% of the total score – reflects the importance of evaluation planning and implementation to OMH.

5. What is *Healthy People 2010*?

Healthy People 2010 (HP2010) is a set of health objectives for the Nation to achieve over the first decade of this century (2001-2010). It can be used by many different people, States, communities, professional organizations, and others to help them develop programs to improve health. Like its predecessors, Healthy People 2000 and the disease prevention/health promotion objectives laid out in the 1979 Surgeon General's Report, HP2010 was developed through a broad consultation process, built on the best scientific knowledge, and designed to measure programs over time. The goals, objectives, and priorities established by OMH are intended to support the goals and objectives of HP2010 and, therefore, where possible, efforts funded by OMH

need to demonstrate their link to *HP2010* goals and objectives. More information about *HP2010* is available at www.healthypeople.gov.

6. What is the National Partnership for Action to End Health Disparities?

The National Partnership for Action to End Health Disparities (NPA) is an OMH-led initiative to mobilize a broad network of organizations and individuals to address the persistent health disparities that place a greater burden of preventable disease and premature death on racial/ethnic minorities in the U.S. The NPA has five main objectives:

- To increase awareness of health disparities
- To strengthen leadership at all levels for addressing health disparities
- To improve patient-provider interaction
- To improve cultural and linguistic competency
- To improve coordination and utilization of research and outcome evaluations Prospective and current OMH grantees are considered to be part of this network of partners, and are expected to support selected NPA objectives as appropriate.

7. If objectives are supposed to be measurable, does that mean that they have to be quantitative (such as numbers of people served, numerical scores on questionnaires, or changes in health statistics)?

No. Being "measurable" simply means being able to show, through the collection of data or information, that something is different from something else or how it has changed over time. A project objective is measurable if changes from the conditions described in baseline data can be shown in a convincing way. Some objectives describe things that can be counted (or that are quantitative), such as numbers of people receiving training; numbers of people receiving or providing particular kinds of services; numerical scores on questionnaires about people's knowledge, attitudes, or behavior; or, the numbers of people giving similar responses in interviews. Sometimes, however, measuring change is simply showing that something has been created that did not exist before, such as a new policy, a new organization, a new source of funding, a new training program, or a new building.

8. What are baseline data?

Baseline data are basic information or data that are available or can be collected before a program, project, or activity begins. Such data are used to provide a starting point against which to compare data collected later in the program, project, or activity in order to determine if there has been a change in specific conditions over time.

9. What is the difference between an outcome and an impact?

In evaluation, an outcome is generally used to describe a *short- or intermediate-term* result of an activity, such as changes in knowledge or attitudes, behavioral change, or policy changes. An impact is generally a *long-range* result of an activity and can be a direct or indirect consequence of an activity. In evaluation, impacts are more desirable than shorter-term outcomes because they are more likely to show changes or improvements in health status.

10. What is a performance measure?

A performance measure is a particular value used to measure program activities, impacts and outcomes. A measure should represent the actual data or information that will be collected at the program or project level to measure the specific activities, outcomes, or impacts that the program/project is designed to achieve. Therefore, performance measures are generally developed for each program or project objective.

11. What is a logic model?

A logic model is a tool that describes how a program or project should work, presents the planned activities for the program or project, and focuses on anticipated outcomes. They are called "logic" models because they are very useful in helping program or project planners and evaluators to identify and clarify the "logic" or rationale behind what is being done and how programs or projects should work. Logic models typically tie together: *long-term problem(s)* to be addressed; *factors* that must be addressed that contribute to the problem(s); *strategies and practices* and supporting resources that can be mobilized to address the factors and the problems; and *measurable impacts and outcomes* that can be expected to result from implementing the strategies and practices – as these relate to the long-term problem(s).

12. What are the different types of evaluation methods that should be used?

Generally, there are five major types of evaluation methods: (1) process evaluation which examines the tasks and procedures involved in implementing a program, project, or activities, including the administrative and organizational aspects of, and delivery procedures involved in, the efforts; (2) outcome evaluation which is used to obtain descriptive data on a program or project and to document (typically) short- and intermediate-term results; (3) impact evaluation which focuses on the long-range results of the program or project, and changes or improvements as a result (for e.g., long-term maintenance of desired behavior, reduced absenteeism from work, reduced morbidity and mortality); (4) formative evaluation which is typically conducted during the development (or formation) of a strategy, program, or product (including trained personnel) to assess (or 'test') their strengths and weaknesses before implementation; and (5) summative evaluation which looks at a combination of measures and conclusions for larger patterns and trends in performance, to assess, in summary, whether the program or project overall did what it was designed to do. A good evaluator can help grant applicants identify and select the evaluation method(s) needed to determine whether expected results have been achieved.

13. Although pre- and post-activity assessments have been used in past or current evaluation efforts, it is often difficult to see evidence of achievement. Are there better ways to use such assessments for evaluation purposes?

Many times when responding to a pre-activity questionnaire or test instrument, people try to present the best possible image of themselves. As a consequence, the post-activity test instrument may show very little change. Such results are fairly common

in evaluations of activities seeking changes in behavior. To be able to measure changes with less bias, an alternative approach may be to use the pre-activity survey retrospectively. That is, the pre-activity survey is not given until *after* the activity, and people are asked to *recall* their opinions or behavior before the activity. Then, the post-activity test instrument is administered. With this technique, the ability to identify and measure change may be improved.

14. What is the difference between a best practice and an evidence-based practice or strategy?

A best practice is a program, process, method, technique, or other activity for which effectiveness in achieving specified outcomes/impacts or objectives/goals has been demonstrated or suggested across a number of implementations and evaluations. A best practice may also refer to a way of accomplishing a task that has been determined to be most efficient (least effort or expenditure for result desired) or most effective (best result), based on repeated use of the practice for large numbers of people over time. An evidence-based practice or strategy is one in which the best scientific or research evidence of what is effective for a desired result has been integrated into the effort.

15. Obtaining evaluation expertise to prepare the grant application may be difficult. Is it really necessary?

Yes. Grant applications are more likely to be successful if proposals demonstrate that adequate and appropriate expertise will be available to the project to ensure that expected results can be identified, measured, and achieved. External evaluators are not required, but may be useful in the preparation of evaluation plans. Local colleges and universities with faculty, staff, and graduate students who are engaged in academic research are often good sources for such expertise. However, it is important for such individuals to also have knowledge and experience with the populations and health issues being addressed. Depending upon the culture or the primary language spoken by the target population(s) involved in the project, it may be necessary for the evaluators to also understand that culture and speak the language of the population(s) in question. Grant applicants should note that evaluation training and targeted technical assistance on evaluation are provided to new grantees by OMH contractors shortly after award.

16. Do evaluation results need to be submitted to OMH? If so, how are such results submitted?

All OMH grantees are required to submit program/project data and results via OMH's Uniform Data System (UDS) and through requested reports. The UDS is a cross-program, uniform data reporting system that was recently developed to support OMH's efforts to monitor progress for its funded efforts. Further details and training on the UDS and OMH reporting requirements will be provided to all new grantees at a time specified by OMH following grant awards.

17. Are there other resources that OMH would recommend to guide the development of our evaluation plan?

OMH's evaluation planning guidelines suggest several resources for more information on logic models. These include:

- The University of Wisconsin-Extension web site at http://www1.uwex.edu/ces/lmcourse
- http://www.uidaho.edu/extension/LogicModel.pdf
- http://www.wkkf.org/Pubs/Tools/Evaluation/Pub3669.pdf
- http://www.cdc.gov/eval/resources.htm#logic%20model

In addition, the Centers for Disease Control and Prevention provides a set of evaluation resources in a variety of topical areas, available at:

• http://www.cdc.gov/eval/resources.htm
